

AI Intelligence Node System

Concept Description

Author: Yancheng Zhu

Date: 2026-03-12

1. Overview

This document records the conceptual design of a system architecture called the “Signal-Triggered Local AI Intelligence Node System” .

The idea proposes building a local AI node capable of monitoring macroeconomic signals and activating artificial intelligence analysis modules only when certain trigger conditions are detected.

2. Core Architecture

The proposed system contains the following components:

- Signal Monitoring Module
- Trigger Detection Engine
- AI Intelligence Analysis Module
- Multi-source Data Aggregation Layer
- Macro Risk Scoring Engine

The system architecture emphasizes event-driven activation of AI models instead of continuous processing.

3. Design Objective

The purpose of this architecture is to create a macro intelligence analysis tool that:

- Reduces computational costs
- Improves responsiveness to macroeconomic signals
- Integrates multiple information sources
- Generates a dynamic macro risk score

4. Notes

This document records the conceptual framework only.

Detailed implementation methods and algorithms are not disclosed in this document.

This file serves as a time-stamped conceptual record of the system architecture idea.
